

# Laboratory Work No. 1

## Setting Up a Relational DBMS

### Objective:

Learn how to install and run a relational database system.

### Introduction:

A relational database stores data in tables with rows (records) and columns (attributes). This model was introduced by Edgar F. Codd (1970) and allows flexible data management. A Relational Database Management System (RDBMS) is software that manages these databases. Examples: MySQL, PostgreSQL, SQLite, Oracle, SQL Server, MariaDB.

### Task:

1. Choose one RDBMS (e.g., MySQL or SQL Server).
2. Write a **simple step-by-step guide** for installation and setup. Include:
  - i. Downloading the software
  - ii. Installing it
  - iii. Creating a sample database
  - iv. Testing with a simple query (e.g., `SELECT 1;`)
3. Include **screenshots** to show each step.

Good luck!
