

Laboratory Work No. 3

Querying the Relational Database

Objective:

Practice writing SQL queries to retrieve specific information from the university database created in previous labs.

Introduction:

In this lab, you will use the database schema and data from your previous work to perform various queries. These queries will help you better understand data retrieval, filtering, and basic relationship navigation using SQL.

Task:

Using your existing university database, write SQL queries for each of the following:

1. List the names and departments of all instructors who earn more than 80,000.
2. Display the course titles and credits of all courses offered by the Computer Engineering department.
3. List all distinct buildings where courses are taught during the Fall 2023 semester.
4. Show the names of students who are advised by instructors in the Software Engineering department.
5. Retrieve the IDs and names of students who have taken the course “Database Management Systems”.
6. Display all instructors who teach at least one course in the Spring 2024 semester.
7. List all prerequisite courses (with titles) for “Operating Systems”.
8. Find all courses that are taught in room “AS115”.

Deliverables:

1. A report containing your **SQL queries** and their **outputs**.
2. Include **clear screenshots** showing both the query and its result.
3. Make sure your results are well formatted and readable.

Good luck!
